

WARNING: The Lite version of Project Aqua is only for devices with RAM in MEGABYTES!

We recommend using Standard Project Aqua for full functionality and more features.

Project Aqua: Lite Edition

A minimalist, ultra-efficient web shell designed specifically for the Samsung Galaxy On8 (2016) and legacy hardware running Android 7.0 (Nougat).

Core Features

- **Memory Focused:** Operates within a strictly enforced 10MB-15MB RAM footprint.
- **Zero-Cache Engine:** Disables disk caching to prevent "SSD" bloat and thermal throttling on older NAND chips.
- **Full-Screen Immersive:** Removes the URL bar to give you maximum screen space on 5.5" displays.
- **DuckDuckGo Lite Integration:** Default search provides privacy and high speed on slow networks.

⚙️ Instructions & Controls

1. **Browsing:** Since there is no address bar, use the DuckDuckGo search box for both searching and typing URLs (e.g., type "google.com" and hit search).
2. **Incognito Mode:** **Long-press the Search Bar** area. This triggers a temporary "Private Window" state that clears all volatile session data on exit.

3. Navigation: Use the phone's **Hardware Back Button** to go back. If you are on the homepage, the back button will close the app.

4. Performance Tip: If the app feels laggy, clear your "Recent Apps" to free up system memory for the WebView engine.

Installation (Vostro Build)

Ensure your `build.gradle` points to `com.project.aqualite`. Install the generated `app-release.apk`. You can keep both Standard and Lite versions installed simultaneously.
